

## IELTS Sample Essay

**According to you, what are the major problems due to which developed countries have become the major contributors to global warming? What are the main problems leading to global warming?**

Answer:

Certainly, the increasing level of venomous gases in the atmosphere have caused environmental degradation to a massive extent. To an extent, it is true that the developed nations are turning as prime contributors to global warming. With our planet facing unprecedented climate changes, one of the major factors behind global warming is the anthropogenic approach and the inception of the industrial revolution. It is believed that the industries have emitted tonnes of carbon destructing our natural resources and thus adding to the climate crisis.

As per my opinion, rapid industrialization and urbanization are hazardous for the environment. While developing countries were the main contributors to global warming, it is unfortunate that developed nations are following the suit. The conversion of greener lands into residential areas lead to deforestation while the reckless discharge of industrial wastes resulted in a hazardous impact on our natural resources. Greenhouse gases majorly include water vapour, carbon dioxide, methane, nitrous oxide and fluorinated gases. Amongst these, carbon dioxide contributes up to 60% of the greenhouse gases which has resulted in the disturbance of the carbon cycle and global warming.

Since developed countries are the role model for developing nations, they must realise the harm they are doing to our planet and why it is important to take a thought-out approach in combating the same. Many prominent environmentalists have played an imperative role in spreading awareness about climate change. Sustainable development and environmental conservation has become the need of the hour. The world needs to understand the repercussions of climate change on the planet earth and how we can take effective measures to minimise it and secure our future generations from.
